WORK HISTORY

Boston Dynamics – Staff SQA Engineer - Full Time **March 2026 – Present**

- Led reorganization of a 700+ test case library, defining Smoke, Sanity, and Regression with clear criteria and definitions. The redesign is targeted to cut the regression cycle from 3 months to 1 month, and strengthen quality through tiered testing.
- Drive SQA automation strategy by mapping the new Smoke/Sanity/Regression tiers against existing coverage, prioritized automation candidates, automated 25% of Smoke tests so far, to shift manual checks left to catch regressions earlier.
- Own the HIL CI/CD pipeline and drive Gen 2 robot bring up. Identified Gen 2 parity gaps and scoped them into stories (~50% complete), coordinating cross-team work on hardware sourcing Raspberry Pi-controlled relay integration.
- Hardened and expanded the Appium UI automation suite after infrastructure and framework changes, growing coverage from 16 to 33 automated tests and updating previous tests to follow the new structure.
- Own triage for nightly Hardware-in-the-Loop (HIL) robot runs: investigate failures, produce root-cause summaries, route hardware issues to the correct teams, and implement hotfixes. Surface regressions early so developers can bisect to the offending PR.
- Wrote Confluence documentation on manual test case best practices and onboarded new members on TestRail process and expectations.

Boston Dynamics – Senior SQA Engineer - Full Time **September 2023 – March 2026**

- Built a Python-based monitoring tool (usable standalone or as a Pytest fixture) that collects onboard robot metrics over SSH, with real-time visualizations and CSV exports for performance tracking.
- Introduced app automation with Appium on emulated Android tablets for UI-driven test cases, parameterized language tests, merged and adapted them for nightly HIL runs.
- Integrated automated tests into CI/CD pipelines with stage-based reporting and stakeholder failure notifications.
- Used Gazebo SIM worlds to facilitate test case creation and development for later execution on real hardware.
- Designed and implemented a structured training plan to onboard non-SQA team members, verifying tool access and QA best practices to ensure testing consistency.
- Facilitated communication between developers and testers to accelerate issue resolution.
- Served as a project lead and primary QA point of contact for product refresh; oversaw progress and issue tracking with weekly leadership reporting on testing status and blockers.

SharkNinja – SQA Engineer II - Full Time **April 2022 – September 2023**

- Led and mentored junior SQA engineers and contractors during sprints; managed test execution, defect tracking, and daily standups.
- Coordinated with cross-functional hardware/software teams to design test procedures and protocols.
- Aligned priorities and triaged issues with other teams when receiving releases.

SharkNinja – SQA Engineer - Full Time **November 2019 – April 2022**

- Designed and executed manual test cases from SRS documentation; logged defects in Jira and collaborated cross-functionally to ensure high-quality releases across backend cloud tools and user-facing mobile apps.
- Assisted the automation team by debugging and improving Python scripts.
- Documented procedures in Confluence and supported onboarding and training of new QA team members through mentoring and knowledge sharing.

SharkNinja – Product Development Intern - Full Time **April 2019 – November 2019**

SKILLS

Testing and Automation:	Pytest, Appium, Selenium, X-Ray, TestRail, Zephyr, Buildkite, Jenkins
Programming Languages:	Python, TypeScript, C, C++, C#, ASP.NET, HTML, CSS, Bash
Developer Tools:	Git, VSCode, Cursor, Android Emulation
Programs:	Jira, Confluence, Microsoft Office/Google tools
AI-Assisted Development:	Claude Code, Copilot, Gemini Code Assist, CodeRabbit, MCP tools
Operating Systems:	Windows, Ubuntu, macOS, Android/iOS
Languages:	English (Fluent), Spanish (Fluent)

Projects

The State of Ecosystems 2026 — React Report Experience – Handed off to HubSpot

- Leveraged Figma MCP to build an interactive website experience for HubSpot's State of Ecosystems partner report as a React + Vite 6 project
- Implemented client-side filtering; supports 17 content variants on specific pages, driven by URL-hash as the filter state. Copy and stats are served from a JSON content layer so content could be updated without modifying components
- Met vendor requirements including WCAG 2.1 AA, Lighthouse performance/SEO, and a ~50 KB main-JS budget via lazy-loading and code-splitting
- Coordinated a handoff to HubSpot's web development team.

Paychira — Full-Stack SaaS – Developed for Datalily

- Leveraged AI tools to design, build, and deploy a sales-forecasting tool for small agencies: features a deal pipeline, probability-weighted revenue forecasts, org/team roles, CSV import, PandaDoc contract synchronization, and AI chat, on the pipeline data.
- Front end: React 18, Vite, Tailwind (Hosted on Vercel); Backend: FastAPI, Pydantic REST API (Hosted on Render); Database: Supabase
- Automated PR process; Implemented Gemini Code Review and CodeRabbit in the repository to provide feedback and improve code quality. Pulled deployment status from Vercel and Render as checks to confirm success status, before merging.

EDUCATION

Boston University, Boston MA — May 2017
Bachelor of Science in Computer Engineering
